

1. (30 Points)

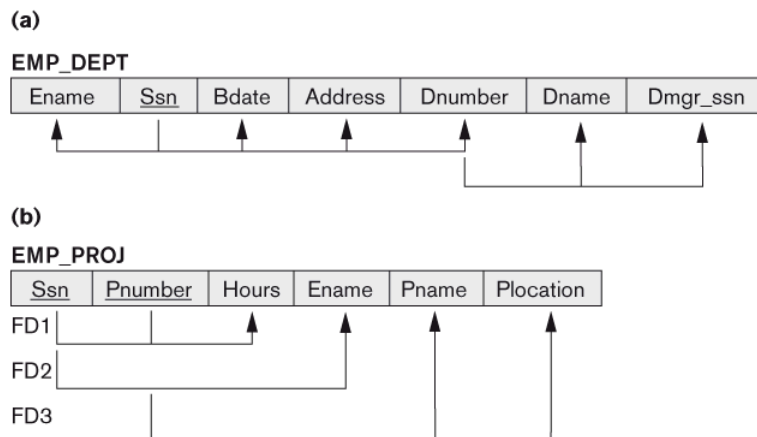

Figure 1: Two relation schemas suffering from update anomalies

Give one insertion anomaly, one update anomaly, and one deletion anomaly that could happen in the *EMP\_PROJ* and *EMP\_DEPT* relations of Figure 1 and Figure 2.

EMP_DEPT							Redundancy

Figure 2: Sample states for EMP\_DEPT and EMP\_PROJ

2. (30 Points) Consider the following relation for art works displayed in an art gallery: *ARTWORK*(*Title*, *ArtistName*, *Type*, *ListPrice*, *ArtistAffil*, *Dealer*)

ArtistAffil refers to the affiliation of the artist. Suppose the following dependencies exist:

*Title* → *Dealer*, *Type*

*Type* → *ListPrice*

*ArtistName* → *ArtistAffil*

- (a) What is a candidate key of this relation? Explain your answer.
- (b) Apply normalization until your relations are in 3NF. State the reasons behind each decomposition.

3. (20 Points) Consider the following relation:

*R* (*Doctor#*, *Patient#*, *Date*, *Diagnosis*, *Treat\_code*, *Charge*)

In this relation, a tuple describes a visit of a patient to a doctor along with a treatment code and daily charge. Assume that diagnosis is determined (uniquely) for each patient by a doctor on a specific date. Assume that each treatment code has a fixed charge (regardless of patient). Is this relation in 2NF? Justify your answer and decompose if necessary. Then argue whether further normalization to 3NF is necessary, and if so, perform it.
